

# Wrangle and Analyse Data¶

In the following project I am going to gather and analyze data all around the Twitter account WeRateDogs. For that, data is gathered via manual download, programmatical download and over an API. After that I am going to assess this data, define the issues found during the assessment and clean these issues to get a cleaned master dataframe.

## Libraries needed¶

In [0]:

```
import requests #download data
import numpy as np #array functions
import pandas as pd #data handling
import tweepy #twitter api
import json #handle json data
import matplotlib.pyplot as plt #data visualization
import seaborn as sns #data visualization
import re #text processing
```

```
/usr/local/lib/python3.6/dist-packages/statsmodels/tools/_testing.py:19: FutureWarning:
pandas.util.testing is deprecated. Use the functions in the public API at
pandas.testing instead.
```

```
import pandas.util.testing as tm
```

### Read the csv file

In [0]:

```
url = 'https://raw.githubusercontent.com/hiyabose/Data-Analysis/master/twitter-archive-
enhanced.csv'
df_twitter = pd.read_csv(url)
```

```
df_twitter.head(3)
```

Tweet image predictions (image\_predictions.tsv)

To gather this data we are going to define the file - url, request this url and write the content of the response to a separate file.

In [0]:

```
url = "https://d17h27t6h515a5.cloudfront.net/topher/2017/August/599fd2ad_image-  
predictions/image-predictions.tsv"
```

```
#get response
```

```
response = requests.get(url)
```

```
#write return to an image
```

```
with open("image_predictions.tsv", mode = "wb") as file:
```

```
    file.write(response.content)
```

In [0]:

```
df_predict = pd.read_csv("image_predictions.tsv", sep='\t')
```

```
df_predict.head(3)
```

## Data Assessing

Now we will look at all the dataset and see where we need to clean the data

**df\_twitter**

In [0]:

```
fig, ax = plt.subplots(figsize = (9,7))  
ax = sns.heatmap(df_twitter.isnull(), vmin=0, vmax = 1)
```

Here from the visual we can see that there a lot of missing datas in the reply and the retweet section

In [0]:

```

Also we can see that there is incorrect data type

1. tweet\_id is int but it should be string
2. timestamp is object but it should be data and time

We can see that:

1.the predictions are sometimes lowercase, sometimes uppercase

1. there is an underscore instead of a whitespace between the words
2. there are rows with no prediction of a dog (neither in 1, 2 nor 3)

This dataset looks okay. There is no missing values and only thing that needs to be changed is tweet id datatype to string

## Assessing Summary¶

## Quality¶

df\_twitter table

1. the datatype of the id - columns is integer and should be str
2. the datatype of the timestamp - column is object and should be datetime
3. some of the dogs are not classified as one of "doggo", "floofer", "pupper" or "puppo" and contain all "None" instead
4. some of the dog names are not correct (None, an, by, a, ...) contains retweets
5. some of the ratings are not correctly extracted (mostly if there are >1 entries with the pattern "(\\d+(\\.\\d+)?\\d+(\\.\\d+)?)"
6. also transforming the ratings to integer created some mistakes (there are also floats)
7. the source column contains html code

df\_predict table

1. the datatype of the id - columns is integer and should be str

2. contains retweets (duplicated rows in column jpg\_url)
3. there are pictures in this table that are not dogs
4. the predictions are sometimes uppercase, sometimes lowercase
5. also there is a "\_" instead of a whitespace in the predictions

df\_api table

1. the datatype of the id - columns is integer and should be str

## Tidiness¶

df\_twitter table

1. the columns doggo, floofer, pupper and puppo are not easy to analyze and should be in one column

df\_predict table

1. the prediction and confidence columns should be reduced to two columns - one for the prediction with the highest confidence (dog)

df\_api table

1. display\_text\_range contains 2 variables

all tables

1. All three tables share the column tweet\_id and should be merged together.

## Data Cleaning¶

Cleaning steps:

1. Merge the tables together
2. Drop the replies, retweets and the corresponding columns and also drop the tweets without an image or with images which don't display doggos
3. Clean the datatypes of the columns
4. Clean the wrong numerators - the floats on the one hand (replacement), the ones with multiple occurrence of the pattern on the other (drop)
5. Extract the source from html code
6. Split the text range into two separate columns

7. Remove the "None" out of the doggo, floofer, pupper and puppo column and merge them into one column
8. Remove the wrong names of name column
9. Reduce the prediction columns into two - breed and conf
10. Clean the new breed column by replacing the "\_" with a whitespace and make them all lowercase

Define:

merge the tables

## Data Analysis¶

Questions:

1. Based on the predicted, most likely dog breed: Which breed gets retweeted and favorited the most overall?
2. How did the account develop (speaking about number of tweets, retweets, favorites, image number and length of the tweets)?
3. Is there a pattern visible in the timing of the tweets?

In [0]:

```
#read in the master csv
df = pd.read_csv("twitter_archive_master.csv")
df.head()
```

The soft-coated wheaten terrier got a very high mean rating. In fact, the labrador retriever got overall the biggest rating with 165, but since there are a lot more tweets with labrador retriever than for the soft-coated wheaten terrier, the one big rating of the soft-coated wheaten terrier has a higher weight then the one of the labrador retriever (14 tweets of soft-coated wheaten terrier and 105 of labrador retriever).

Not taking the outlier into account, this leads us to an average rating of 11. Based on the number of posts, retweets, favorites and mean rating, we will give the title of "Most overall liked dog of this Twitter account and its community" to the labrador retriever.

Over the timeperiod of 2016 the number of post per months decreased. It went from 134 tweets in January to 52 in December. Does this mean, that the performance of this account is also decreasing?

If we look at it over the whole timeperiod it becomes even more clear. In April 2016 the number of tweets dropped and since then it has a relatively stable level. To see if the performance of the Account decreased we will take a look on the favorites and retweets that the posts get.

If we look at the average number of favorites and retweets the clear uptrend gets even more clear! Now let's see if the number of posted images per month or the average upper text range changed over time.

In [0]:

```

```

As we can see in this graphs of 2015 and 2016, the most posts are during the night between 0 (included) and 5 'o clock. between 4 and 15 'o clock there is a very small amounts of tweets, in fact there is no single

tweet for the hours 7 - 12 and 14 o' clock. There are some tweets after 14 'o clock, but not as much as between 0 (included) and 5 'o clock.

# Summary and Conclusions¶

In this project we went through a whole data wrangling process. The gathering included the programmatical, manual download as also the gathering via an API. Also the cleaning part covered a lot of techniques like regular expressions or the overall handling of dataframes.

In the analysis we took a look at following questions:

Questions:

1. Based on the predicted, most likely dog breed: Which breed gets retweeted and favorited the most overall?

The winner for our analysis was the labrador retriever.

2. How did the account develop (speaking about number of tweets, retweets, favorites, image number and length of the tweets)?

We found, that the number of tweets per month decreased, while the retweets and favorites show an uptrend. For the image numbers there is no clear trend visible, the length of the tweets got a little bit closer to the maximum of 130 in the second half of the dataset.

1. Is there a pattern visible in the timing of the tweets?

Here we found, that between 5 and 15 'o clock there are nearly no tweets at all. The most tweets are during the time from 0 - 4 and then from 15 - 23, but from 15 - 23 are less tweets than between 0 - 4.
